USER MANUAL | VERSION 1.16

Harrison ExcelFlow

1.0 Harrison ExcelFlow

Harrison ExcelFlow brings Excel automation tools together in one desktop app. This manual explains the current **DISC & FTG Reports** module. Other modules and features will be added in future updates.

Open the application

Extract the entire ZIP into a folder. Open **Harrison ExcelFlow.exe** inside **Harrison Excelflow**, then click **DISC & FTG Reports** on the main menu.

Keep the application folder together
Keep the executable, **_internal**, **settings.json**, **report_styles.json** and the other supplied files together. Do not run the app from inside the ZIP preview. Python, Microsoft Excel, an internet connection and sign-in are not required to generate reports.

Your monthly workflow

Step	Action
01	Select a DISC workbook, an FTG workbook, or both.
02	Confirm the detected month/year and choose the report options.
03	Choose an output folder, then validate and review the dates.
04	Generate reports. Wait for completion, then open the results.

In this manual

Section	Topic	Page
1.0	Harrison ExcelFlow and getting started	1
1.1	DISC & FTG Reports: files and reporting period	2
1.1.2	Report choices and output location	3
1.1.3	Validation, generation and completed reports	4
1.1.4	IG mappings and report settings	5
1.1.5 / 1.2	Troubleshooting / future modules	6

REPORT MODULE

1.1 DISC & FTG Reports

Use this module to validate raw data, normalize supported dates and numbers, and generate formatted monthly Excel reports. The raw workbooks are read without being overwritten.

1.1.1 Select files and confirm the reporting period

1. Choose your raw workbooks

Click **Browse...** beside **DISC workbook** and select the raw DISC file. Do the same for **FTG workbook** if you also want FTG reports. Supported file types are **.xlsx** and **.xlsm**.

One workbook is enough
You can process DISC only, FTG only, or both. Place each file in its matching input field. If you explicitly choose DISC or FTG under **Workbooks to process**, that input must be supplied.

2. Check the detected month and year

By default, the app reads the **YYMM** suffix in the selected filename. The first two digits are the year (2000-2099); the last two are the month (01-12). Month and Year appear grey because automatic detection controls them.

Raw filename	Detected reporting period
ALL_DISC_2610.xlsx	October 2026
ALL_FTG_2610.xlsx	October 2026
ALL_DISC_2701.xlsx	January 2027

When both inputs are processed, their filename periods must agree. The filename sets the expected period; it does not override conflicting dates or invoice-period values inside the workbook.

3. Use manual selection only when needed

For a file without the expected filename pattern, open **Settings**, untick **Detect month and year from filenames (YYMM)**, and click **Done**. Select the correct Month and Year on the reporting screen.

How Document Date recovery works

With swapped-date recovery enabled, the app uses the reporting period to resolve supported date formats. For example, **10/13/2026 00:00:00** becomes **13/10/2026** for October 2026. A value such as **2026-02-10** can be interpreted as 2 October when the reporting period supports that correction.

Always review corrected dates
The app also checks invalid dates and period conflicts. Use **Validate & preview** and inspect the date preview before generating. Unsupported or unresolved values may need correction in the source data.

CHOOSE WHAT TO PRODUCE

1.1.2 Report options

The two button groups control different choices. The selected button is highlighted in teal.

Workbooks to process

Selection	What it does
Both	Processes every workbook you supplied. One input is still enough.
DISC	Processes only the file in the DISC workbook field.
FTG	Processes only the file in the FTG workbook field.

Report version

Selection	What it does
Both	Produces Normal and Special report versions from the selected inputs.
Normal	Uses the normal rules: DISC promotions beginning IPCD; FTG promotions beginning IPCF. Normal processing also includes N/A promotion values.
Special	Uses the special rules: DISC promotions beginning IPCF; FTG promotions beginning IPCD.

Example
To produce only the standard DISC reports, supply the DISC file, select **DISC** under Workbooks to process, and select **Normal** under Report version. To produce both versions for both inputs, supply both files and select **Both** in both groups.

Choose the output location

Click **Choose folder...** in **Output location** and choose where to save your results. Check the path shown beside **Save reports to**. Each generation creates a separate run folder within that location.

Check before starting

Confirm that the input files are correct, the month and year match the raw data, the two selection groups match your needs, and the output location is correct. If agency names need updating, use **Manage IG names** before the run.

The app normalizes supported numeric text, identifiers and whole-number fields during validation. It reports values it cannot safely interpret. Monetary and quantity display precision can be adjusted in Settings; see page 5.

RUN AND REVIEW

1.1.3 Validate and generate

1. Validate the selected inputs

Click **Validate & preview**. This reads and checks the selected workbooks without generating reports. Wait for validation to finish.

2. Review the details page

Click **View run details**. Switch between the tabs below, then use **Back to report** to return. Your selections and details stay available during the session; the details page can also be viewed while processing continues.

Tab	Use it to
Date preview	Compare Input, Excel row, Original value, Normalized date and Result for sampled date values. This is a preview, not a display of every row.
Run log	Review row counts, corrections, conversions, warnings, completion timings and the saved results path.
Issues	Find input, row, column, raw value and issue details. Up to 500 issues are shown; use validation_issues.csv for the complete list when one is produced.

3. Generate the reports

If validation passes and the preview looks correct, return and click **Generate reports**. Generation performs validation again. The percentage shows processing progress, not estimated time remaining. Use **Cancel** if you need to stop.

4. Wait for successful completion

When the status says **Complete** and reaches **100%**, the app plays one short completion chime. Windows volume or mute settings control whether you hear it. Validation-only runs, errors and cancellations do not play the completion chime.

The status area and Run log show **Validation**, **Report generation** and **Total** durations in full words. These measure processing time, excluding file selection and your review time. Validation-only runs show report generation as **Not run**.

Open and check the completed reports

Click **Open results** to open the run folder. Normal reports are under **Formatted [Month] [Year]**. Special reports are under **Formatted [Month] [Year] (DISC with IPCF, FTG with IPCD)**. Inside, reports are grouped into DISC or FTG folders and branch workbooks.

Check the period, branch, agency headings and totals in the generated workbooks. The run folder also contains **run_summary.json** with run status, generated files and timings, plus **validation_issues.csv** when issues were recorded. If no rows match a report version, no workbook is required for that combination; the Run log records it.

MAINTAIN YOUR REPORT PREFERENCES

1.1.4 Mappings and settings

Manage IG names

On the report screen, click **Manage IG names**. The list maps IG numbers to agency names used by the reports. Use Search to find an existing entry.

Task	Steps
Add a mapping	Click New / clear. Enter the IG number and IG / agency name, then click Add.
Edit a mapping	Select an entry. Change the IG number or name, then click Update selected.
Remove a mapping	Select the entry and click Remove selected.
Save your changes	Click Save mappings. Changes apply to the next report run. Cancel discards unsaved edits.

Removing a name does not remove transactions
An unmapped agency heading shows **IG [number] (unmapped)**. Add or restore the mapping to supply the agency name. Saved mappings are also used by the FTG IG reference sheet. Keep **settings.json** when transferring the app so your mappings are retained.

Report settings

Click **Settings** on the report screen. Keep the defaults unless your reporting requirements call for a change. Click **Done** to return.

Setting	Meaning
Amount (RM) decimals	Monetary display precision, from 0 to 6 decimal places; default 2. Also used for P160 rounding. For example, 2 places displays 12.50.
Quantity decimals	Quantity display precision, from 0 to 8 places; default 2. Underlying quantities are retained.
P160 multiplier	Multiplier used for the P160 secondary discount calculation; default 0.88. Change only when the reporting rule changes.
Detect month and year from filenames (YYMM)	On by default. Switch off to select Month and Year manually.
Recover swapped dates using the reporting period	On by default. Uses the expected period to resolve supported swapped month/day dates.

IG mappings are saved explicitly. Other report controls are retained while the app is open; check them again when starting a new session. Existing workbooks are not retroactively changed by editing settings or mappings.

HELP AND FUTURE MODULES

1.1.5 Troubleshooting

What you see	What to do
Filename or period error	Check the DISC/FTG input fields and YYMM suffix. If both inputs are selected, their periods must agree. For other filenames, disable automatic detection and choose the period manually.
Month and Year are grey	Automatic filename detection is enabled. This is expected. Change the detection option in Settings if manual selection is needed.
Validation errors; no reports generated	Open View run details and select Issues. Use Open results for the full validation_issues.csv. Correct the identified source values, then validate again.
Unrecognized date or number	Check the raw value, column and reporting period shown in Issues. Supported formats are normalized automatically; invalid or conflicting values require review.
An agency shows as unmapped	Open Manage IG names, add or correct the IG number/name, save the mappings, then generate a new run.
Fewer workbooks than expected	Confirm Workbooks to process and Report version. Check the Run log: combinations with no matching promotion codes do not require a workbook.
Processing was cancelled or stopped	Treat partial output as incomplete. Check the status and Run log, resolve the cause, then generate a fresh complete run.
No completion sound	Check Windows volume and mute settings. The chime plays only after successful report generation, not after validation alone.

Before sharing the output

Confirm the run finished successfully, the reporting period is correct, and the required branches and versions are present. Review any warnings and check the workbook totals before distributing the reports.

1.2 Future modules

More to come
New modules and features will be added in future updates. Instructions for those modules will be included when they become available.

This edition covers **DISC & FTG Reports** only. It reflects Harrison ExcelFlow version **1.16**.
